

Dock-Watch Thermostat

The Dock-Watch Dual Probe Thermostat was designed to give customers the highest possible energy savings consistent with high reliability.

The Dock-Watch is actually two thermostats in one — the upper thermostat measures the air temperature while the lower thermostat measures the temperature below the water line.

Air temperature is measured well above the water

A second temperature is measured under the water

When both the air and water temperatures reach freezing, the Dock-Watch Thermostat will automatically turn on your de-icer, saving your dock and boat from damage that can occur when lake water turns to ice.

Dock-Watch Thermostats are just \$189.50 and can save thousands in repair while providing peace of mind all winter long.
